

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claim 1 (currently amended) A conduit holder, comprising:

a main body having a central upwardly open channel extending therethrough, said channel being sized and shaped for supporting ~~receiving~~ a bottom portion of the conduit resting within the channel ~~therein~~;

an upright support member secured to a bottom of the main body, said support member being configured for securing to a structural member.

Claim 2 (original) The conduit holder of Claim 1, wherein said support member is adapted for supporting the main body and the conduit in an elevated position.

Claim 3 (currently amended) A conduit holder, comprising:

a main body having a central upwardly open channel extending therethrough, said channel being sized and shaped for supporting a bottom portion of the conduit resting within the channel;

an upright support member secured to a bottom of the main body, said support member being configured for securing to a structural member ~~The conduit holder of Claim 1~~, wherein said main body is adapted for free rotational movement in relation to the support member.

Claim 4 (original) The conduit holder of Claim 1, wherein said support member is provided with a plurality of openings to allow attaching of the support member to a structural member.

Claim 5 (original) The conduit holder of Claim 1, wherein said main body has a generally arcuate configuration to accommodate cylindrical conduits positioned therein.

Claim 6 (original) The conduit holder of Claim 1, wherein said support member has a pair of telescopically engaging parts to allow extension of the support member to a desired elevation.

Claim 7 (currently amended) A duct holder, comprising:

a main body having a generally U-shaped configuration and a central upwardly open channel ~~opening~~ sized and shaped to accommodate a bottom portion of the duct resting within the main body; and

an upright support member secured in a free rotational relationship to a bottom of the main body, said support member being attachable to a structural member for supporting the main body and the portion of the duct in an elevated position in relation to a base surface.

Claim 8 (currently amended) The duct holder of Claim 7 ~~6~~, wherein said support member has an elongated body and a plurality of opening formed in the elongated body to allow attaching of the support member to a structural member at a pre-determined height in relation to the base surface.

Claim 9 (currently amended) The duct holder of Claim 7 ~~6~~, wherein said main body is rotatably engaged with the support member.

Claim 10 (currently amended) The duct holder of Claim 7 ~~6~~, wherein said support member has telescopically extendable portions to allow positioning of the main body at a desired elevated level.

Claim 11 (currently amended) A duct holder, comprising:

a main body with a central upwardly open channel defining a receiving area for a bottom portion of a duct; and

an upright support attachable to a structural member for supporting the portion of the duct in an elevated position in relation to a base surface without constricting air flow moving through the duct, said upright support member is secured in a free rotational relationship to the main body.

Claim 12 (original) The duct holder of Claim 11, wherein said support member has telescopically extendable portions for adjusting elevation level of the main body in relation to the base surface.
